

SOFTWARE:

The software we have is designed to pull all the Google location with store ID for a specific business by uploading that businesses Google link (as shown in stores list attached file). The software collects all the reviews including content and star rating and puts them on csv (see merged file in csv).

Here is the software we had built (attached). It works but constantly breaks down. That's what we need fixed, NOT from scratch.

To get to the EXE folder GoogleReviews/bin/Debug/GoogleReviews.exe

Here is sample store list (attached). Notice the line breaks (empty lines in the file) those are the batches I put in the software.

Next is video of it failing over and over and over.

Programmer should know .net (visual basic, C#), jquery and javascript. If you can fix the freezing and script errors then we can award him the other features.

All the files needed to recode are in the zip.

Budget is \$150 to repair software then \$100 a month to help maintain software as Google makes changes now and again. In the past we've gone 3 or 4 months with no issues but when there is an issue we'll need you available as soon as possible to repair software. That is what we are paying you \$100 a month for!

If you can fix above we also have 3 other software projects with budgets of \$300 to \$700 each.
